New Series ! This series of HITACHI air-cooled water chillers up to 450RT has been developed for various requirements of air-conditioning systems and industrial chilled water systems, where these equipment are operated under high ambient temperatures of 43°C. Therefore, the units can be utilized under a wide temperature range.

These water chillers have utilized the most advanced Hitachi R134a refrigerant special semi-hermetic twin-screw compressor, featuring high reliability, low noise and low vibration, and highly efficient air-cooled condenser, resulting in compact design.

The unit is composed of compressors, air-cooled condensers, shell-tube type water coolers, and other auxiliary and control devices, compactly packaged in a weather-proof cabinet which is constructed of galvanized steel plates processed with specially baked resin paint.

1.Features

1.1 Features

Unit - The unit shall be an air-cooled screw type water chiller with R134a refrigerant, and shall be factory-completed with screw-type compressors, refrigeration cycle(s), air-cooled condensers, shell-and-tube water coolers, condenser fan motors, a star-delta starter, protective and safety devices, Electronic expansive valves and compressor discharge stop valves, and shall be factory-assembled, piped, internal wired and charged with R134a refrigerant. The unit shall be completely weather-proofed for outdoor installation. The unit shall comply with Chinese Industrial Standards and other Chinese Industrial Standardization statutes, including safety codes.

Capacity - The cooling capacity of the unit shall be ____ kW or greater under the following conditions:

____ m³/h chilled water flow rate,

____ °C chilled water inlet temperature,

____ °C chilled water outlet temperature,

____ m². °C/W fouling factor for the water-side heat exchanger or greater.

The water-side heat exchanger pressure decrease shall not exceed ____ kPa.

The compressor power input shall not exceed ____ kW under the prescribed conditions.

Power Supply - The unit shall operate on ____ V, ____ Hz, three-phase current, and shall be capable to operate within maximum ____ V and minimum ____ V.

Dimensions and Weight - The height of the unit shall be ____ mm, the width shall be ____ mm, and the depth shall be ____ mm. The weight of the unit shall not exceed ____ kg.

Cabinet - The cabinet shall be constructed of galvanized steel, baked with synthetic resin paint. The service panels shall be easily removable for service access to the electrical components such as magnetic switches and electrical devices.

Compressor - The compressor shall be a semi-hermetic compressor from the same manufacturer. The compressor shall be serviceable type. The compressor protection system shall include an overcurrent relay, a pressure switch, a timer relay and an internal thermostat embedded in the motor winding.

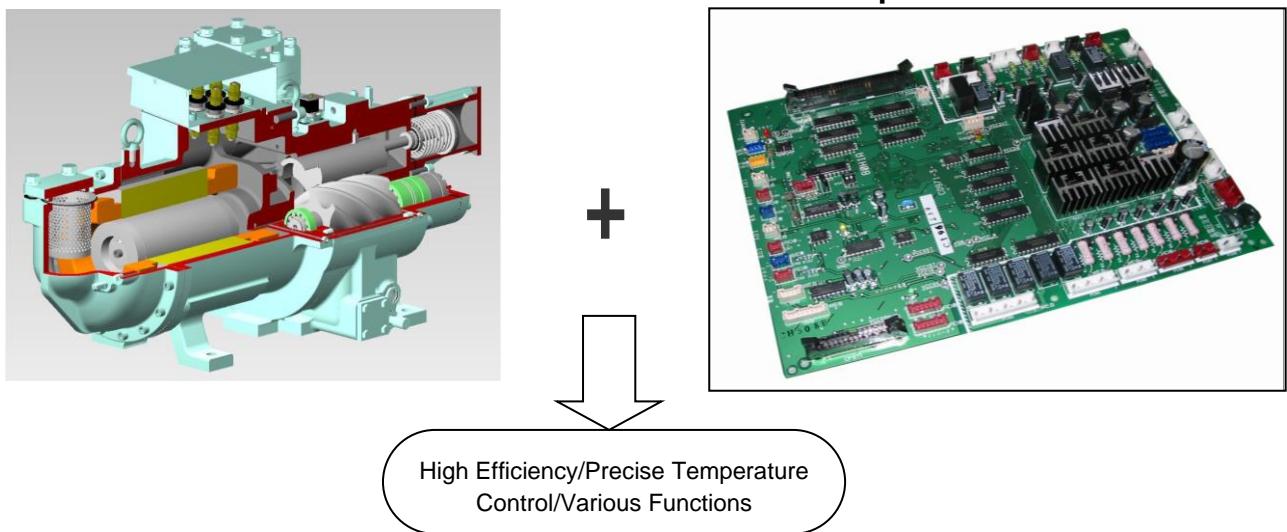

Water-Cooler - the water cooler shall be the dry expansion type with a horizontal welded steel construction shell, containing inside tubes. The refrigerant side of the water cooler shall be cleaned, dehydrated and tested for leakage at the maximum permissible working pressure of ____ MPa. The water side of the water cooler shall be cleaned and performed water pressure test at ____ MPa.

Air-Side Heat Exchanger Fan and Fan Motor - The fan shall be the propeller type directly driven by a ____ kW motor. The motor shall be thermally protected from overloaded conditions with a thermal overcurrent relay and shall be permanently lubricated, The winding and bearing of the condenser fan motor shall be weather-proof construction.

Condenser - The condenser shall be the multi-pass, cross-finned tube type, equipped with aluminum slit fins, mechanically bonded to seamless, oxygen-free copper tubes. The condenser shall be cleaned, dehydrated and tested for leakage at the maximum permissible working pressure of ____ MPa.

Accessories - Standard accessories shall include vibration-proof mats, foundation bolts.

The Combination of HITACHI Screw Compressor and Microcomputer
Inclines HITACHI Air-Cooled Chillers to be perfect

Various

The new model has been installed with microcomputer and can offer the functions as below:

- Independent warning hint
The independent warning, such as stopping operation in high pressure and low pressure can be shown on the controlling board via warning signal.
- Operations of converting compressors
The operation order of multiple compressors can be converted in order to balance the service hours of compressors. This function can help to lengthen life-span of the unit.
- Other functions
Besides above functions, the following devices are equipped:
Long distance/live switch, indicator of temperature of chilled water and the automatic starting after temporary electrical power cut.
- BMS communication function (Protocol converters as the optional components)

LCD(liquid crystal display) operative interface

LCD(liquid crystal display) running and display interface

Lower Noise, Lower Vibration and Reliable Long Period Operation...

The Hitachi Screw Water Chiller Can Meet Your Requirements!!

The most advanced Hitachi G Style Semi-hermetic screw compressor

G style semi-hermetic screw compressor has the features of simple structure, quite operation and long service life.

A Symmetrical Rotor Profile and Other Features

This profile of the compressor rotor, 4:6 (male and female) type, assures excellent efficiency even in high compression ranges, in addition to these uniquely-profile rotors, the following features are incorporated. Use of special bearing, resulting in long life and high reliability. Patented capacity control system, enabling simple control system. High precision and high-grade finishing rotors, enabling no oil-cooling system

Easy for Maintenance

Equipped with accessibility components such as Pressure Relief Valve and Oil Sight Glass, easy maintenance is obtained.

Single power supply

The unit has two compressors only needs one power supply. This kind of system can reduce the cost of power supply spent by users.

Factory-Charged

The cooling cycle is charging refrigerant under the circumstance of rigid quality control and is enclosed. Therefore, it can be installed and operate within a short time.

Factory-Wires

Only power wiring and water piping are required in the field.

Most Reliable Protective and Ancillary Components

The units are protected against any assumed failure of operation, based on the following components: Electronic Timer for Compressors, Three-Phase Quick Response Over current Relay, Internal Thermostats for Compressor Motors, Freeze Protection Thermostats. Pressure Relief Valve, Oil Sight Glass, Oil Heater and Reverse-Phase Protection Relays for Compressors.

Standard Accessories

The following accessories are supplied with the unit

- a. Vibration-Proof Rubber Mats
- b. Acoustic panel for compressor
- c. Water connection companion flange
- d. Spreader bar for rigging

Other optional accessories

The following accessories are optional, Please get in touch with HITACHI or HITACHI distributor if required:

Protocol converter that connects with the building automation system (Modbus RTU protocol option)

Notes

1.The nominal cooling capacities are based on GB/T 18430.1-2015(*1)

Chilled Water Outlet Temperature /Nominal water flow: 7 °C / 0.172 m³ / (h·kW)

Condenser Air Inlet Temperature: 35 °C (DB)

2.Applicable Power Supply

Main Power Source: (AC3φ) 380/415V, 50Hz

Control Power Source: (AC1φ) 220/240V, 50Hz

3.The units greater than 200AZY1 including 200AZY1 consist of two or three modules and are separately shipped. (*2).

4.The common chilled water piping (Filed-Supplied) between each water cooler shall be directly connected at site.

Working Range

Item	Standard
Chilled Water Outlet Temperature	5~15°C
Condenser Air Inlet Temperature(DB)	5~43°C

5.Water Flow

1) RCUF200,240,300,360,450AZY1

It is necessary to control the common water flow volume to each cooler.

2) RCUF220,270,330,400,420AZY1

Because the chilled water flow rate is different between No.1 No.2 and No.3 units,it is necessary to control the water flow volume of each unit with adjusting valves (Filed-Supplied).

6.It is required to connect electrical control wires between No.1, No.2 and No.3 units for the unit greater than 200AZY1 including 200AZY1.

7.The nominal pressure of water pipe flange is PN1.6MPa.

Notes

1.The nominal cooling capacities are based on GB/T 18430.1-2015(*1)

Chilled Water Outlet Temperature /Nominal water flow: 7 °C / 0.172 m³ / (h·kW)

Condenser Air Inlet Temperature: 35 °C (DB)

2.Applicable Power Supply

Main Power Source: (AC3φ) 380/415V, 50Hz

Control Power Source: (AC1φ) 220/240V, 50Hz

3.The units greater than 180AZPY1 including 180AZPY1 consist of two or three modules and are separately shipped. (*2).

4.The common chilled water piping (Filed-Supplied) between each water cooler shall be directly connected at site.

Working Range

Item	Standard
Chilled Water Outlet Temperature	5~15°C
Condenser Air Inlet Temperature(DB)	5~43°C

5.Water Flow

1) RCUF180,200,240,270,300,360,405,450AZPY1

It is necessary to control the common water flow volume to each cooler.

2) RCUF320,420AZPY1

Because the chilled water flow rate is different between No.1 No.2 and No.3 units,it is necessary to control the water flow volume of each unit with adjusting valves (Filed-Supplied).

6.It is required to connect electrical control wires between No.1, No.2 and No.3 units for the unit greater than 180AZPY1 including 180AZPY1.

7.The nominal pressure of water pipe flange is PN1.6MPa.

Maximum foundation gradient

The unit shall be vertically installed in the maximum slant range as shown in Figure 1 below.

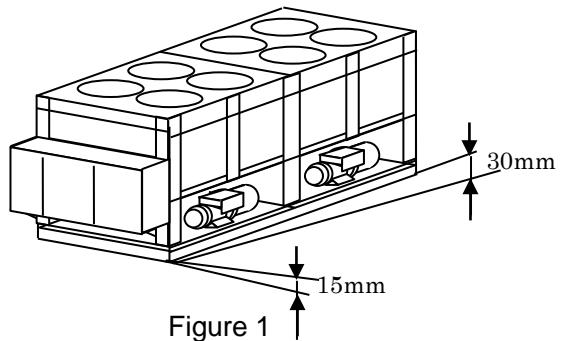

Figure 1

Lifting notes

1. Use lifting metal rope and stay bar supplied by the manufacturer, to keep the unit surface being scratched by the rope. The strength borne by the lifting rope shall be three times larger than the unit weight.
2. Check and ensure whether the lifting hook tightly fastens the unit. The lifting angle shall be larger than 60° . As shown in figure 2.
3. When lifting, please don't stand under the unit.
4. Add cloth between ropes and units to prevent damage of units.

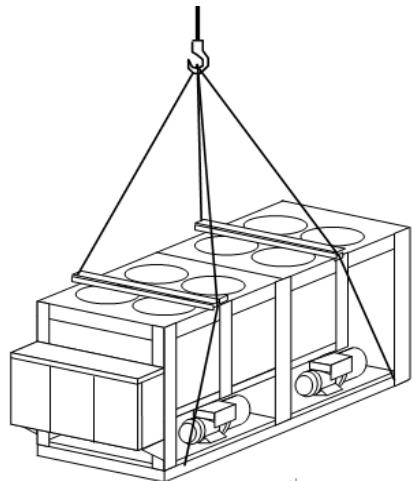

Figure 2

Rolling transport

When the unit rolling, place 7 same size roll bars under the chassis. Each roll bar must support two outer frames of the unit and be fit for balance of the unit.

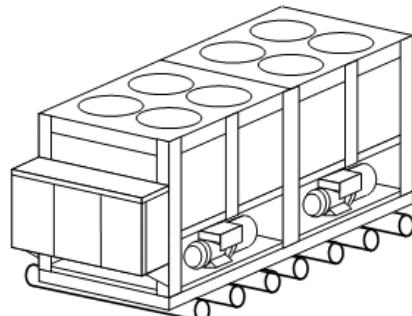

Figure 3

The unit's slant angle when transporting

When transporting, the unit's slant angle shall be not larger than 15° . In case of the slant angle exceeding 15° , the unit may topple over.

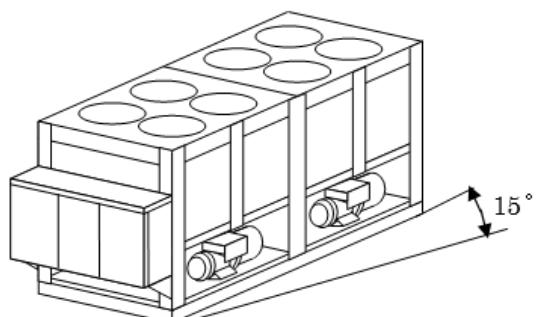

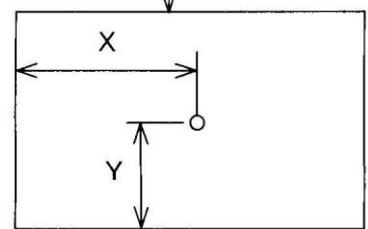

Figure 4

8. Selection Example

Determination the System Requirements:

Condenser Air Inlet Temperature:	40°C
Chilled Water Outlet Temperature	7°C
Chilled Water Inlet Temperature	12°C
Cooling Load	450kW
Power Source Frequency:	50Hz

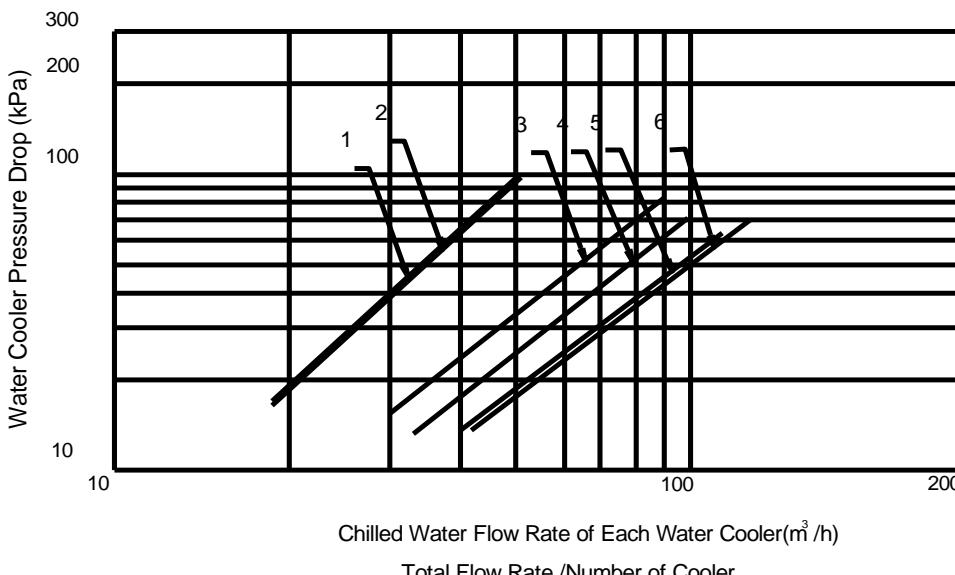

From the cooling capacity table, model **RCUF150AZY1** can be selected with the following performance:

Cooling Capacity: 517kW
 Chilled Water Flow Rate: 88.9m³/h
 Water Cooler Pressure Drop: 45 kPa
 Compressor Input Power: 182.8kW

The water flow rate in the cooling capacity table is based on the 5 °C temperature difference between the chilled water inlet and outlet temperature, if the temperature difference is not 5 °C , correct the water flow rater of the water cooler utilizing follow formulas.

$$\text{Corrected Flow} = \frac{\text{Flow Rate}}{\text{Rate} \times \frac{5^\circ\text{C}}{\text{Given Temperature Difference } (\text{°C})}}$$

The corrected chilled water flow rate must be confirmed to be within the working range described on pages 42.

Cooling Capacity and Compressor Input

When the fouling factor is different from 0.018m². °C /kW, the cooling capacity or the compressor input will be corrected utilizing follow formulas:

$$\text{Corrected Cooling Capacity} = \text{Factor} \times \text{Indicated in Table}$$

and

$$\text{Corrected Compressor Input} = \text{Factor} \times \text{indicated in Table}$$

Correction Factor for Cooling Capacity and Compressor Input Regarding Fouling Factor

	Fouling Factor m ² . °C/kW	Cooling Capacity	Compressor Input
Water	0.000	1.01	1.00
Cooler	0.018	1.00	1.00

ABT: Condensate Air Inlet Temperature (°C)

CLOT: Chilled Water Outlet Temperature (°C)

CCAP: Cooling Capacity (kW)

CFR1,CFR2,CFR3: Chilled Water Flow Rate of No.1 Unit No.2 Unit and No.3 Unit at 5 °C Difference Between Inlet and Outlet Temperature (m³/h).

CPD1,CPD2,CPD3: Water Cooler Pressure Drop of No.1 Unit No.2 Unit and No.3 Unit (kPa)

IPT: Input Power for Unit (kW)

Conversion Multiplier: 1kW=860kcal/h
 =3412Btu/h
 1kPa=0.102mAq

ABT: Condensate Air Inlet Temperature (°C)

CLOT: Chilled Water Outlet Temperature (°C)

CCAP: Cooling Capacity (kW)

CFR1,CFR2,CFR3: Chilled Water Flow Rate of No.1 Unit No.2 Unit and No.3 Unit at 5 °C difference Between Inlet and Outlet Temperature (m³/h).

CPD1,CPD2,CPD3: Water Cooler Pressure Drop of No.1 Unit No.2 Unit and No.3 Unit (kPa)

IPT: Input Power for Unit (kW)

Conversion Multiplier : 1kW=860kcal/h
 =3412Btu/h
 1kPa=0.102mAq

RNC: Running Current

IPT: Power Input

- These data are based on the same conditions as those for the cooling capacity; please refer to the notes for the Unit General Data.
- The starting current is indicated for each compressor.
- The "Maximum Unit Current" is the total running current of the unit under the following conditions, which consume the maximum current within the unit working range.

Supplied Voltage: Rated Voltage×0.9
Condenser Air Inlet Temperature: 43 °C
Chilled Water Outlet Temperature: 15 °C
Capacity Control: 100%

Therefore, the size of wiring and fuses must be determined according to applicable national and local codes.

- In addition to the conditions mentioned in the item 3, the compressor currents can be estimated as shown below.

	One-Compressor
Maximum Instantaneous Current	STC

- The unit power input can be estimated from that of the compressor in the Cooling Capacity Table and that of the condenser fan motor above.

(Voltage:415V)

Model	Unit Main Power		Application Voltage (V)		Compressor(Three Phases)			Motor for Condenser Fan		Maximum Unit Current(A)

RCUF450AZY1	87.5	RCUF450AZPY1	87.5

Notes:

- (1) Sound Data in accordance with JB/T4330.
- (2) Based on the actual state of installation, operation, the influence of ambient noise and echo, lead to actual noise value is higher than the specification (vary according to the state, also have higher about 4 ~ 6 db).
- (3) Should avoid installation to those who are not allowed and the position of the exhaust noise. Such as the need to install the noise sensitive position, need to advance design and installation of the acoustical isolation facilities, to keep the unit running the noise impact on the surrounding environment under control.

12. Working Range

Power Supply:

Working Voltage : 90%-100% Rating Voltage

Unbalanced Voltage : Within $\pm 3\%$ Deviation from Each Voltage at Compressor Terminals

Start Voltage: Higher than 90% of the Rated Voltage

Maximum Water Flow Rate and Minimum Water Flow Rate (m³/h)

Note: Minimum internal system water volume in the above table is setting according to the standard neutral zone temperature. In case of changing the setting, minimum internal system water volume shall be increased as follows.

Water Neutral Zone Temperature	Minimum Water Volume in System
2°C (Standard)	100%
1.5 °C	130%
1 °C	200%

Temperature Range

The temperature range is given in the following table.

13. Component Detailed Data

Compressor

Model of compressor			ASCCW-50ZG	ASCCW-60ZG
Type of compressor	—		Semi-hermetic	
Quantity of rotors	Pair		1	1
Displacement	m ³ /h		272	340
Control of cooling capacity	Continuous control	%	100~25,0	100~25,0
Proof Pressure	Discharge & suction	MPa	3.1	3.1
Pressure of airtight	Discharge & suction	MPa	2.02	2.02
Motor	Type	—	three-phase asynchronous motor	
	Starting method	—	star delta starting	
	Number of poles	—	2	
	Insulation grade	—	F	
	Power	kW	37	45
Lubricating oil	Model	—	ZE-GLES RB68	
	Oil volume	L	6	6

Condenser and Condenser Fan

Note: the data above is indicated for each water cooler, as these units greater than 200AZY1/ 180AZPY1 including 200AZY1/ 180AZPY1 consist of two or three water coolers, in the case the data for each water coolers are different, it is showed as no.1water cooler data + no.2 water cooler data+ no.3 water cooler data.

Refrigerant System

In addition to the basic air-cooled water chiller components (compressor, condenser, electronic expansive valves and water cooler), the following components are equipped in each refrigerant cycle:

Stop Valve for Compressor Discharge Line and Liquid Line:

These stop valves are equipped at the liquid line, and facilitate easy compressor service without appreciable leakage of refrigerant.

Capacity Control

All models are equipped with an unloading system for each compressor, in order to adjust the cooling capacity and provide precise temperature control for the chilled water, coupled with electric thermostat.

Electric Operation Control

The utilization of microcomputer makes Hitachi water-cooled chiller more advanced.

Control Panel

The control panel is equipped with starting button, stopping button, power light, operation indicating light, warning light, button for the operation within refrigerant circulatory system, warning display and checking. The control panel is installed in the place that is convenient to operate. Operation/warning display can show individual warning code, such as high pressure cut-off, low pressure cut-off, etc. This function is beneficial to checking warning that has occurred. Checking button is used to check temperature of chilled water and display the warning information. The adjustment of the chilling water, adjustment of temperature difference ON/OFF and long distance/site controlling are installed on the back of control panel in order to avoid being touched when the unit is operated.

Printed circuit board

Microcomputer, relay and electrical parts are installed on the printed circuit board. Therefore, it does not need the machinery parts and matched wires. It is undoubted that reliability has been improved. Because of adopting the microcomputer, printed circuit board includes multiple kinds of functions as below.

Screw Compressor Cycling Protection Circuit

When the temperature protection device is triggered to make the compressor restart after stopping of compressor, CCP will make the single compressor postpone for 3 minutes to start. To the unit with two or more compressors, when the first compressor is postponed starting for 3 minutes, another compressor will be started every one minute. Thus, it can avoid the damage caused by the circular operation of the compressors.

Electrical temperature detector

It is used to sense the temperature of the chilled water and operate the cooling capacity control magnetic valve of Hitachi screw compressor.

Screw compressor reverse phase protective circuit

The circuit is installed with reverse phase protective relay in order to prevent reverse rotation of compressors due to the error of phase sequence.

Operation of converting the compressor

If the unit has several compressors, the operation order of the compressors can be converted in order to balance the operating hours. Such function can prolong the span-life of the unit.

Restarting after temporary electrical power stopping

When the stopping of power supply is less than 2 seconds, the compressor can start after electrical power supply is recovered for 3 minutes.

Note: for the details of the blank places, please contact HITACHI or Hitachi's distributors.

Protection and Safety Control

The safety and protective devices are equipped in the unit to ensure dependable and long life operation. Their functions should be carefully noted, and field adjustment is not recommended, if the setting is maintained at the point listed in the table.

Compressor Protection

1. The high pressure switch and the low pressure control protect against excessive discharge pressure and exceedingly low suction pressure. The switch and control cut out compressor operation when the discharge pressure exceeds the setting or when the suction pressure decrease below the setting.
2. Overcurrent relays equipped in the magnetic switch box cut out each compressor operation when the current to the compressor exceeds the setting.
3. The internal thermostat embedded in the compressor motor winding cuts out each operations, when the temperature of the motor winding exceeds the setting.
4. An oil heater in the compressor prevents oil from foaming during cold starting. Energize this heater to warm the oil, while the compressor is stopped.

Fan Motor Protection

The thermal overcurrent relays for the condenser fan motors cut out fan operation and compressor operation, when the current to the fan motor exceeds the setting.

Refrigerant Cycle

1. The fusible plug is equipped on the liquid line. When refrigerant temperature exceeds the melting point, the plug melts and purges the refrigerant gas, in order to avoid explosion of the condenser.
2. The freeze protection control, in which the sensor is located in the water outlet near the water cooler, cuts out the compressor operation, when the water outlet temperature decreases below the setting.
